

COVID-19 Staff Symptom Flow Chart

Questions? Contact Human Resources.

QUARANTINE DURATION

If recommended duration is not possible, these two options are acceptable alternatives:

- If a person who is in quarantine has no symptoms, quarantine can end after Day 10. (Day 1 is the first day after exposure.)
- If a person who is in quarantine receives a negative molecular COVID-19 test and has no symptoms, quarantine can end after Day 7. The person must be tested on or after Day 5, and quarantine cannot be discontinued earlier than Day 8. Even if a negative test is received before Day 8, the quarantine period should still be a full seven days.

SYMPTOMS*

Fever (defined as subjective or 100.4°F or higher)	Fatigue
Chills	Headache
Cough	Muscle/body aches
Loss of sense of taste and/or smell	Sore throat
Shortness of breath	Congestion or runny nose
	Nausea or vomiting
	Diarrhea

*That are not explained by an existing condition, such as allergies or asthma.

TESTING

Several types of COVID-19 tests exist, with varying degrees of accuracy. The less accurate antigen tests are suitable for screening purposes or for quick, positive results. To confirm a negative result in someone with symptoms, the test performed must be a molecular test, such as a PCR test.

CLOSE CONTACTS

Generally, "Close Contact" means being within 6 feet of a person with COVID-19 (within 3 feet for students in a classroom)—regardless of whether the individuals are wearing masks—for about 15 minutes or more. Members of a household are considered to be close contacts. Ultimately, local health departments determine possible exposure and quarantine requirements during their investigation.

VACCINATION/PREVIOUS INFECTION

Vaccinated or previously infected persons who are close contacts of someone with COVID-19 are not required to quarantine if they meet the following criteria:*

- Are fully vaccinated (at least two weeks have passed since their second dose (or single Johnson & Johnson dose) OR were previously infected with COVID-19 within the past 90 days and have completed isolation.
- Tested negative with a molecular test if they have 1 or more symptoms (see *COVID-19 Testing* box). If no symptoms, vaccinated/previously infected person should get tested 3-5 days after exposure.
